/note="Vector: Bluescript II SK-; Site_1: EcoRI; Site_2:
Noti: Mature bradyzoites were obtained from infected mouse
brains by percoll density centrifugation. The original
library was constructed by Steve Parmley, Palo Alto
Medical Foundation. CDNAS were synthesized by priming with
oligo d(T) and directionally cloned into the EcoRI/NotI
sites of lambda gill. Warning: the library contains a
small percentage of host cDNAS derived from mouse cells.
Inserts from this cDNA library were excised with Notl and
ECORI, size selected in a range of 0.7 - 2.0 kb and
subcloned into Bluescript II SK- (Adrian Hehl, Ian Manger
and John Boothhroyd, Stanford University)"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Tissue Procurement: Louis M. Tratment of auto-immune disease by admin. of peptide(s) corresp. to major histocompatibility complex antigens - esp. for delaying onset of cilinical symptoms of insulin dependent diabetes by modulating T cell mediated attack on target cells.

Tratment of the contract on target cells modulating peptides that can be used in the method of the invention. These sequences are based on a portion of the method of the invention. These sequences are based on a portion of the method of the invention. These sequences are based on a portion of the generic peptide corresponding to residues 70-91 of the alphal-domain of the major histocompatability complex (MHC) class I antigen (see NVO510). The method is for affecting the course of an autoimmune disease involving T-cell mediated destruction of tissue in mammals. These peptides are used especially to treat insulin-dependent diabetes mellitus, preferably being administered during the pre-clinical stage to delay onset of the disease. Other diseases that can be treated are multiple sclerosis, rheumatoid arthritis, psoriasis, pemphigus vulgaris, sjoren's disease, thyroid disease, Hashimoto's thyroiditis, myasthenia stayet cells, and may also reduce inflammation, swelling, and release of contact of the disease of contact of anotymes etc. associated with T cell activation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                        Claim 13; Page 66; 80pp; English.

This sequence represents a fragment of a class I major histocompatibility complex (MHC) antigen. This sequence corresponds to residues 75-84 of the albha-1 domain of the class I MHC HLA-B7. This sequence, and the peptide fragments represented by R83062-R83085, R83090-R83096 and P82007-R92913 can be used to extend the period of acceptance by a recipient of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to the patient for a limited period of time (compared to the lifetime administration for current treatments). The peptides particularly modulate (or inhibit) the activity of the cytotoxic I lymphocytes (CTLs) of the patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         04-AUG-1997 (first entry)

With a proposition of transplants or treating autoriments of transplants or treating autochmeute diseases.

For treating autochmeute diseases.

Example 1; Page 19; 41pp; English.

Peptides Wi3784-98 and Wi3778-9 were assayed for their immunomodulating compound or variant is claimed which has activity. A peptide-type compound or variant is claimed which has climunomodulating activity, including the N-terminal acylated and/or creminal amidated or esterified forms of up to 60 amino acids, where the peptide-type compound comprises the formula; A-B, where A, B = CC (terminal amidated or esterified forms of up to 60 amino acids, where the peptide-type compound comprises the formula; A-B, where A, B = CC (R aa87-771) [aa79-484] or (aa84-79) (Laa77-76R); aa76 = E or V; aa77 = CC Small amino acid; aa82 = R or L; aa83 = G or R; and as represents amino acid; aa82 = R or L; aa83 = G or R; and as represents amino acid sequences related to a Class I HLA-B alphal domain (positions or any peptide type bond within the brackets. The compounds comprise amino acid sequences related to a Class I HLA-B alphal domain (positions or 19-84). They can be used to inhibit cytotoxic T-lymphocytes (CTL) from undesirably attacking cells in a host or in vitro. They can also be used in combination with antigenic peptides or proteins of interest to activate CTLs. They can also inhibit the proliferation of T cells in a combination of treating autoimmune diseases, e.g. diabetes, and also be also the companiant of the peptide can be used for preventing rejection of transplants or for treating autoimmune diseases, e.g. diabetes, and described the products can also be also the companiant of the peptide can be used for preventing can also be also the companiant of the 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

Example 1: Page 19: 41pp: English.

Peptides W33784-98 and W33778-9 were assayed for their immunomodulating crivity. A peptide-type compound or variant is claimed which has immunomodulating activity, including the N-terminal acylated and/or crivity. A peptide-type compound or variant is claimed which has immunomodulating activity, including the N-terminal acylated and/or cretified forms of up to 60 anino acids, where the peptide-type compound comprises the formula; A-B, where A, B = (R aa76-77L) (aa79-84) or (aa84-79) (Laa77-76R); aa76 = E or V; aa77 = (D, Sor N; aa79 = R or E, aa80 = I or N; aa10 = E or V; aa77 = (D, Sor N; aa79 = R or E, aa80 = I or N; aa10 = E or V; aa77 = (D, Sor N; aa79 = R or E, aa80 = I or N; aa10 = E or V; aa77 = (D, Sor N; aa79 = R or E, aa80 = I or N; aa10 = E or V; aa77 = (D, Sor N; aa79 = R or E, aa80 = I or N; aa10 = E or V; aa77 = (D, Sor N; aa79 = R or E, aa80 = I or N; aa10 = E or V; aa77 = (D, Sor N; aa79 = R or E, aa80 = I or N; aa10 = E or V; aa77 = (D, Sor N; aa70 = R or E, E or E
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Example 15; Page 36; 80pp; English.

R83061-R83085, R83090-R83096 and R92907-R92913 represent fragments of class I major histocompatibility complex (MHC) antigens. This sequence is an inverted dimer of residues 75-84 of the alpha-1 domain of the class I MHC HIA-B7. These sequences can be used to extend the period of acceptance by a recipient of a transplant from an MHC unmatched donor. The peptides are administered to a patient in conjuction with a subtherapeutic amount of an immunosuppressant. This is administered to the patient for a limited period of time (compared to the lifetime administration for current treatments). The peptides particularly modulate (or inhibit) the activity of the cytotoxic I lymphocytes (CTLs)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  HLA-B7 CTL modulating peptide (B7.84-75/75-84).

crivity. A peptide-type compound or variant is claimed which has immunomodulating activity, including the N-terminal acylated and/or c-terminal amdated or esterified forms of up to 60 amino acids, where the peptide-type compound comprises the formula; A-B, where A, B = (C-terminal amdated compound comprises the formula; A-B, where A, B = (C-terminal amino acids, and a and a 27 - (C-terminal amino acids aa81 - R or L; aa83 - G or R; and a represents amino acid. The sequence in the brackets may optionally be absent or truncated at any peptide type bond within the brackets. The compounds comprise amino acid sequences related to a Class I HiA-B alphal domain (positions 79-84). They can be used to inhibit cyctoxic T-lymphocytes (CTL) from undesirably attacking cells in a host or in vitro. They can also be used in combination with antigenic peptides or proteins of interest to activate CTLs. They can also inhibit the proliferation of T cells in response to anti-C2B. The peptide can be used for preventing rejection of transplants or for treating autoimmune diseases, e.g. diabetes, consulting and lupus erythematosis. The products can also be consulted and also be consulted and also the products can also be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New immunomodulating dimer peptide(s) - based on a class I HLA-B alpha-1 domain, used for preventing rejection of transplants or trating autoimmune diseases.

                                                                                                                                                                                   New immunomodulating dimer peptide(s) - based on a Class I HLA-B alpha-1 domain, used for preventing rejection of transplants or treating autoimmune diseases.

Example 1: Page 19: 41pp; English.

Peptides W33784-98 and W33778-9 were assayed for their immunomodulating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     19-JUN-1998 (first entry)
Peptide B7.84-75/75-84 tested for immunomodulating activity.
Immunomodulating dimer; immunosuppressant drug; CTL activation; transplantation; autohamune disease; Class I HLA-B alpha-1 domain;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              HLA-Bw62 CTL modulating peptide (Bw62.60-84).
Cytotoxic T lymphocyte; CTL; major histocompatibility complex; MHC;
immunosuppressant; graft versus host disorder; transplantation: therapy;
class I MHC; HLA-Bw62.
amino acid sequences related to a class I HLA-B alphal domain (position 79-84). They can be used to inhibit cytotoxic T-lymphocytes (CTL) from undesitably attacking cells in a host or in vitto. They can also be used in combination with antigenic peptides or proteins of interest to activate CTLS. They can also inhibit the proliferation of T cells in response to anti-CD3. The peptide can be used for preventing rejection of transplants or for treating autoimmune diseases, e.g. diabetes, rheumatoid arthritis and lupus erythematosis. The products can also be used for detection and diagnosis.
                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

While of the comprising lymphoid surface membrane proteins - which may inhibit cytolytic activity and differentiation of CTLS.

Example 12. 29pp. English.

Example 12. 29pp. English.

R65413, and R65415.R95431 represent palindromes and fragments of R65413. And R65415.R95431 represent by R65416. And R65415. And R65
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                        HIA-Bw62. These sequences can be used to extend the period of acceptance by a recipient of a transplant from an MFC unmatched donor. The peptides are administered to a patient in conjunction with a subtherapeutic amount of an immunosuppressant. This is administered to the patient for a limited period of time (compared to the lifetime administration for current treatments). The peptides particularly modulate (or inhibit) the activity of the cytotoxic I imphocytes (CILS) of the patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               HLA-B7.60-84.

Name 1 leucocyte associated antiquenes and radgments on the man-leucocyte associated antiquenes. This sequence represents the HLA-Bw62.60-84. These sequences can be used to isolate the protein from a T-cell lysate. P74 is a T-cell surface membrane protein of sesociated with T-cell activation in mammalian T-cells, and is also immunologically cross reactive with the heat shock protein HSC70. P74 is found in a limited number of cell types, but is particularly expressed on a and T cells. P74 can be isolated by lysis of a suitable cell with an amphoteric detergent, and then passed through an affinity column containing a covalently bound HLA-B3702 palindromic peptide.

Containing a covalently bound HLA-B3702 palindromic peptide.

Containing a covalently bound HLA-B3702 palindromic peptide.

Containing a covalently for their effect on the cytolytic activity of T-cells, by combining them with the extracellular portion of p74 and determining the amount of binding between the candidate compound and p74.

Modulation of CTL activity can be inhibited in a cellular composition containing T-cells and antigen presenting cells (APCS), by adding to the mix the extracellular portion of p74, in an amount sufficient to compete with the present of the p74 in an amount sufficient to compete with the process.

Example 4, Fig 4, 43pp; French.

The present sequence is encoded by clone GM3 and represents a region from a protein of multiple sclerosis-associated retrovirus MSRV-1.

Peptides that specifically react with antibodies from multiple sclerosis (MS) patients can be derived from the sequence. The peptides can be used to diagnose or monitor multiple sclerosis, and to detect the multiple sclerosis and to detect the autiple sclerosis exection in untitiple sclerosis or MSRV-1. The peptides can also be used for "fixation" of multiple sclerosis or MSRV-1 antibodies in blological samples, especially serum, cerebrospinal fluid or urine. Vaccines can also be prepared from the peptides.

Gene 169:17-23(1996).
-!- FUNCTION: THIS PROTEIN BINDS DIRECTLY TO 23S RIBOSOMAL RNA AND IS
-!- COATED AT THE A SITE OF THE PEPTIDYLIRANSFERASE CENTER.
-!- SIMILARITY: BELONGS TO THE L16P FAMILY OF RIBOSOMAL PROTEINS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Bacillus

"Structural interpretation of the amino acid sequence of a second
domain from the Artemia covalent polymer globin.";
J. Biol. Chem. 26:14285-14281(1990).
-!- SUBUNIT: ARTEMIA HEMOGLOBIN IS A DIMER OF TWO SIMILAR SIZED
SUBUNITS: EACH SUBUNIT REPRESENTS A GLOBIN CHAIN WHICH EXISTS IN
TWO FORMS (ALPHA AND BETA), THUS MAKING POSSIBLE THREE DIFFERENT
PHENOTYPES (HBI, ALPHA(2), HB2, ALPHA/BETA, HB3, BETA(2)). THE
GLOBIN CHAIN IS A POLYMER OF EIGHT HEME-BINDING COVALENTLY LINNED
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       STRAIN-ATC 15697 / PAO1;
LIAO X., HANCOCK R.E.W.;
SUBMITTED (MAY-1996) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: ACTIVATES THE TRANSCRIPTION OF THE SOXS GENE WHICH
ITSELF CONTROL THE SUPEROXIDE RESPONSE REGULON. SOXR CONTAINS A
ZPE-2S IRON-SOLIEUR CLUSTER THAT MAY ACT AS A REDOX SENSOR SYSTEM
THAT RECOGNIZES SUPEROXIDE. THE VARIABLE REDOX STATE OF THE FE-S
CLUSTER MAY THUS BE EMPLOYED IN VIVO TO MODULATE THE
TRANSCRIPTIONAL ACTIVITY OF SOXR IN RESPONSE TO SPECIFIC TYPES OF
OXIDATIVE STRESS (BY SIMILARITY).
-!- SUBUNIT: HOWODIMER (BY SIMILARITY).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Pseudomonas aeruginosa.

Blochchaftsry 26, 6910-6914 (1987)
In [1], they determined the nucleotide sequences of all exons and their surrounding regions of human TH gene, and the exon/intron boundaries are shown. The boundaries were determined by comparing the genomic DNA sequence with the cDNA sequence. The human TH gene is split into 14 exons. In [1], they concluded that the four types of human TH mRNA are produced through alternative splicing from a

PT Glaim 17; Page 50; 66pp; English.

CC The sequences given in Q72630-55 are probes which were used to discriminate HIA-B alleles which are characterised by having the sequences for these sequences which may also be used are given in Q72656-CC Variants of these sequences which may also be used to distinguish to Filmers given in Q72630-35. These primers may be used to distinguish between HIA-B types which are serologically difficult to discriminate, eg. B54(22), B78(17). Using this method, HIA-B compatibility CC between donors and recipients of organ transplants can be increased, thereby having a beneficial impact on success-rate of organ and bone-comparrow transplants. HIA-B typing may be used to improve or facilitate CC disease susceptibility studies and forensic investigations.

Claim 7; Page 42; 66pp: English.
The sequences given in Q72636-55 are probes which were used to discriminate HLA-B alleles which are characterised by having the sequence 5'-GCCA-3' at position 30-33 of exon 2 of the HLA-B allele. Variants of these sequences which may also be used are given in 072656-81. These probes are used to identify the amplification products of the prèmers given in Q72630-35. These primers may be used to distinguish
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     U.750.4.

between HLA-B types which are serologically difficult to discriminate, eg. B54(22), B55(5), B7801, B62(15), B75(15), B71(70), B46, B59, B53, B5102, B5103 and B58(17). Using this method, HLA-B compatibility between donors and recipients of organ transplants can be increased, thereby having a beneficial impact on success-rate of organ and bonemarrow transplants. HLA-B typing may be used to improve or facilitate disease succeptibility studies and forensic investigations.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                TPA PCR primer.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Example 4; Page 50; 87pp; English.

A cDNA clone of human tissue plasminogen activator (tPA) was simplified by PCR using the primers given in 087368-69. The amplified tPA DNA (08770) was ligated into vector KS+ to obtain plasmid TPA-KS+. The construct was used in combinatorial methods involving RNA splicing-mediated shuffling of tPA domains improved thrombolytic properties.

  Example 4: Column 42: 56pp; English.

PCR primers V37316-17 were used to amplify the human tissue plasminogen activator gene. The PCR product was used to construct plansid TPA-KS+, which is used in the course of the invention. The specification describes a purified reverse-splicing intron which comprises a segment comprising a 5-part of a group II intron, including an exon binding site not naturally present in the intron and a second segment comprising a 3'-part of a group II intron, including a domain V motif, a branch as teceptor, and a nucleophilic group for transesterifying a phosphodiester bond of an RNA. Together the two segments form an autocatalytic Y-branched intron which catalyses integration of at least the reverse-splicing introns are used, by specific cleavage and ligation of discontinuous nucleic acid, to generate new genes and gene products, and anipulation, e.g. replacements for restriction enzymes) or anipulation, e.g. replacements for restriction enzymes) or anipulation, e.g. replacements for restriction enzymes) or antibody and orders.

New recombinant alpha-virus vectors - used to develop prods and methods for use in gene therapy and in the prodn. of vaccines

Example 3: Page 92: 256pp; English.

Primer XSVSD4647F (T30827) contains a buffer sequence allowing enzyme digestion, a XhoI site, and nucleotides 4647-4675 of SV40.

CI twas used with reverse primer XSVSA4562R (T30828) to insert an XboI site into the SV40 small t antigen intron to site into the SV40 small t antigen intron to be inserted into eukaryotic layered vector initiation systems (ELVIS) (see also T30787) at a unique XhoI site immediately downstream of 5' sindbis sequences. Recombinant alphavirus expression vectors contg.

Che SV40 promoter are useful in methods of gene therapy and for vaccine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 02-0cT-1998 (first entry)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence
                                                                                            WELL SOURCE TO SPECIFIC TO SPECIFIC TO SPECIFIC CARMON NAME A SPECIFIC SPECIFIC NEW hepatitis B virus nucleic acid with combination of specific New hepatitis B virus nucleic acid binding interactions are useful for. e.g. detection of binding interactions specification and HBV nucleic card sequences proceed from fulminant hepatitis B virus (FHBV) variants, in the course of the invention. The specification describes Hepatitis B virus (HBV) can card that has a mutation (i.e. alteration from the normal conclected in any of the genotypes A to F) in at least two of the chancer I region, the negative regulatory element region, the enhancer CC in/core upstream regulatory sequence/ basal core promoter region, or a mutation which leads to an X-peptide amino acid change to Cys or Met. CC II/ core upstream regulatory sequence/ basal core promoter region, or a mutation which leads to an X-peptide amino acid change to Cys or Met. CC The HBV variants of the invention are used to detect binding interactions considered disease, especially fullminant infection, but also severe chronic infection or serologically fullminant infections are used to detect of the expecified mutations are associated with fullminant infections in extensions are associated with fullminant infections in extensions are associated with fullminant infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                of the specified mutations are associated with fulminant infections, probably because they reduce the ability to bind inhibitory proteins in the host cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Antisense PCR primer C27 used amplify nucleic acid from FHBV variants. Fulminant hepatitis B virus; variant; FHBV; HBV; binding interaction; HBV-related disease; PCR primer; ss.
utilised in the pharmaceutical, food, detergent, and baking industries.

The Alpha retrouble of the structural protein expression cassettes - for producing recombinant alpha:virus particles

Example 3; Column 73; 140pp; English.

Example 3; Column 73; 140pp; English.

POR primers V42367-420 and V4242-54 are used in the course of the protein expression cassette which comprises an inducible promoter and an alphavirus structural protein gene, where the promoter and capression of the alphavirus structural protein gene upon induction of the promoter within a cell, and where prior to induction within the cell; the expression cassette does not express sufficient quantities of structural proteins to be cytotoxic to a BHK cell containing the structural protein gene upon induction of structural protein gene upon induction of cell; the expression cassette does not express sufficient quantities of structural protein gene upon induction of structural protein general p

Alphavirus vectors constructs containing a 5' promoter of viral cDNA by in vitro transcription - used in gene therapy

Example 3; Column 73; 140pp; English.

Correct primers V70724-25 are used to amplify the SV40 small t antigen intron sequences. The amplified product is used in the production of the alphavirus vector constructs of the invention. These constructs comprises a promoter 5' of viral cDNA which initiates the synthesis of RNA from the viral cDNA by in vitro transcription, followed by a complex tanscription of alphavirus RNA.

Collowed by a nucleotide sequence encoding alphavirus nonstructural proteins, a viral junction of a subgenomic fragment is prevented, an theraal ribosome entry site or a sequence which promotes ribosome crash those entry site or a sequence which promotes ribosome entry site or a sequence which promotes ribosome crash those and alphavirus sequence. The recombinant alphavirus

Contors can be used for gene therapy.

Example; Page 24; 32pp; English.

The sequences given in Q63756-60 are synthetic oligomers which were used in the construction of a DNA fragment encoding the mature mink growth hormone (MGH) to which has been added the pre-sequence of the neutral protease of Aspergillus oryzae and a Kex 2 recognition sequence. The mature mink growth hormone (MGH) coding sequence was isolated using the probe given in Q63754. This probe was based on the sequence of rat growth hormone and lead to the isolation of a 700 bp fragment. Replacement of the mink growth hormone pre-sequence by the pre-sequence derived from the neutral protease of Aspergillus oryzae allows effective production of MGH by recombant microorganisms.
                                                                                                                                                                                                                                                                                                                                                                                                                                        Mink growth hormone/A. Oryzae neutral protease pre-sequence oligomer. Probe; isolation; mink growth hormone; MGH; rat growth hormone; pre-sequence; neutral protease; Aspergillus oryzae; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                09-AUG-1993; 103623.
